

PlatformEQ EML Viewer

User guide — internal team · July 2026

What it is

PlatformEQ EML Viewer is a Chrome extension for opening **.eml** email files on your computer. Email content is read and displayed locally — it is not uploaded to a server for viewing.

Installing

- Open the link IT provides (Chrome Web Store internal app), or find **PlatformEQ EML Viewer** in your company's Chrome extensions.
- Click **Add to Chrome**.
- Pin the extension icon on the toolbar (puzzle piece → pin).

Opening an email

Click the **PlatformEQ EML Viewer** icon in Chrome.

On the import screen, either:

- **Drag and drop** an **.eml** file onto the drop zone, or
- **Click** the drop zone and choose a file from your computer.

Supported file types: **.eml**, **.txt**, **.mht**, **.mhtml**. The email opens in a new tab.

Reading the email

- **Header** — subject, from, to, cc (if any), and date.
- **Body** — HTML or plain text in the main reading area.
- **Inline images** included in the file display in the body when possible.
- **Links** in the email open in a new browser tab when you click them.

Attachments

- Attachments appear in a list below the header when present.
- **Images and PDFs** — click to preview in a new tab.
- **Other file types** — click to download to your computer.

Opening another file

Click **Open another file** in the viewer toolbar to return to the import screen.

Privacy and data

- **Email content** (subject, body, attachments, names) stays on your computer while Chrome is open.
- When you **fully quit Chrome**, opened emails are removed from the extension's local storage.
- The extension may send **usage statistics** to an internal PlatformEQ service (for example, whether an import succeeded and coarse file-size ranges). It does **not** send email subject, body, filenames, or attachment content.

Limitations

- **Outlook .msg files** are not supported — use .eml when possible.
- **No reply, forward, or search** — view only.
- **Remote images** in HTML emails may not load (by design, for security).
- In some **Epic / remote desktop** setups, drag-and-drop from Epic may not work. Save the file to a shared location or use the extension inside the virtual session if IT recommends that.

Troubleshooting

Problem	What to try
Nothing happens when I drop a file	Use the file picker instead. Confirm the file ends in .eml
"File too large" message	The file exceeds the size limit. Contact IT if you routinely need larger files
Email layout looks wrong	Some HTML emails render differently here than in Outlook. Compare with another viewer if needed
Extension missing after an update	Open chrome://extensions and confirm PlatformEQ EML Viewer is enabled

Getting help

Contact your IT team or PlatformEQ support with your Chrome version and a short description of the issue. You do not need to send email content.
